Charmless B decays at Belle II

Tuesday, May 18, 2021 5:15 PM (20 minutes)

Charmless B decays provide a unique portion of the Belle II program. The expected large signal yields with moderate backgrounds associated with efficient reconstruction of neutral particles enable world-leading determination of the CKM phase α/ϕ_2 , a conclusive understanding of the so-called $K\text{-}\pi$ CP puzzle, and further insight into the nature of localized CP violation in three-body decays. We report preliminary measurements based on the sample collected during 2019-2020 operations and corresponding to 65 fb^{-1} of integrated luminosity. Results include a test of the $K\pi$ isospin sum-rule, an angular analysis of $B \rightarrow \rho^+ \rho^0$ decays, and the reconstruction of a $B^0 \rightarrow \pi^0 \pi^0$ signal.
